

WiFi Mobility Report

Sat Jun 01 08:13:35 PDT 2019

Objective

The Candela Roam test uses the forced roam method to create and roam hundreds of WiFi stations between two or more APs with the same SSID on the same channel or different channels. The user can run thousands of roams over long durations and the test measures roaming delay for each roam, station connection times, network down time, packet loss etc.. The user can run this test using different security methods and compare the roaming performance. The expected behavior is the roaming delay should be 50msecs or less for all various kinds of fast roaming methods to avoid any form of service interruption to real-time delay sensitive applications.

Roam Percentage per Duration

Station Roam Times

Roam to AP Times

Station 4-Way Auth Times

4-Way Auth per AP Times

The migration is verified after the Auto-Verify timer has expired. If the migration has not completed in that time, it will be counted as failed.

Migration Totals
